Evidence from UK Health Forum - PHB 57 / Tystiolaeth gan Fforwm Iechyd y DU - PHB 57
About the UK Health Forum

The UK Health Forum (UKHF), a registered charity, is both a UK forum and an international centre for the prevention of non-communicable diseases (NCDs) including coronary heart disease, stroke, cancer, diabetes, chronic kidney disease and dementia thru a focus on up-stream measures targeted at the four shared modifiable risk factors of poor nutrition, physical inactivity, tobacco use and alcohol misuse. UKHF undertakes policy research and advocacy to support action by government, the public sector and commercial operators. As an alliance, UKHF is uniquely placed to develop and promote consensus-based healthy public policy and to coordinate public health advocacy. UKHF works to encourage integrated policy approaches that link prevention of NCDs with sustainable development, climate stabilisation, human rights and the reduction of health inequalities.

We welcome the opportunity to respond to the Health and Social Care Committee’s call for evidence.

Public Health (Wales) Bill – Summary of Interest

The UKHF has been involved with and interested in the future of public health in Wales for some time. In February 2013, we hosted an all-day seminar in Cardiff with the Royal Society for Public Health (RSPH), Institute of Healthcare Management (IHM) and the Institute for Welsh Affairs to discuss the Green Paper A consultation to collect views about whether a Public Health Bill is needed in Wales and the value of public health law. In addition to numerous responses to the Green Paper, this meeting served as the impetus for a commissioned paper on public health law and NCDs, which UKHF published in partnership with RSPH and IHM in summer 2013 (please see Appendix 1).

In November 2014, UKHF co-hosted a policy development roundtable with RSPH, Royal College of Physicians Cymru and University of Wales Trinity Saint David. The purpose of the roundtable was to look at the proposed aims, objectives and outcomes from the - at the time - proposed Well-being of Future Generations Bill and its potential impact on public health. A report highlighting the key points and recommendations from the day was produced and shared with key stakeholders (please see Appendix 2).

UKHF along with its partners and members have also responded to all previous consultations on related white papers and proposed legislation.

Globally, NCDs are increasingly responsible for serious health and economic burdens to governments. Because treatment of these diseases is expensive, prevention is highly cost-effective. Unchecked, NCDs will create exponentially unsustainable demands on health and social care services
and be a major risk to sustainable and economic development, leading to a mal-distribution of health and social inequalities. Inequalities account for approximately 18.9 lost years in life expectancy in Wales between the highest and lowest socio economic classes.\(^1\) Wales is one of the highest ranking NCD burdened countries on global comparative league tables. However, with the right legislative powers this could be addressed and place it well ahead of other nations who fail to take such action.

There are many effective ways in which policy and public health law can be utilized to influence NCD determinants including litigation against industry, advertising or marketing restrictions, or financial measures, all of which have proven remarkably effective in reducing risk factors.\(^2\) The key points which we encourage the Government to consider with regards to public health in Wales are:

- Any legislation the Government proposes should begin with a clear and simple preamble which sets out the goals and principles of any law (see box on following page).
- The Government needs to consider all areas and options available under UK and EU law.
- Mandating Health Impact Assessment (HIA). HIAs are important for indicating how new policies will impact – positively or negatively – on population health. Mandating their use will ensure consistent application across government departments and agencies. **UKHF notes HIAs have been removed from all new and currently proposed legislation in Wales.**
- The measures under any new legislation should provide the social conditions and impetus for shifts in culture and environment needed to support health and reduce inequalities.
- Legislation can renew focus on prevention and wellbeing.
- The ability to efficiently introduce necessary health protection – inclusive of environmental, communicable and non-communicable hazards – in secondary legislation or reserved powers.

---

**Summary of submission**

- We strongly support Wales’ interest in Health in All Policies and the new Future Generations Act.
- We support the proposal to create a tobacco retailers’ register.
- We acknowledge electronic cigarettes as a new and evolving public health issue.
- Current voluntary smoking bans for hospital grounds, school grounds and children’s playgrounds are not sufficient.

UKHF is pleased to see the proposal for separate legislation on minimum unit pricing of alcohol – as was originally included in *Listening to you: Your health matters* - and strongly support the introduction of a MUP at the level of at least 50p/unit.

However, we are concerned that key prevention measures have been left out of the proposed Public Health (Wales) Bill, most notably, provisions to tackle obesity including policies to address nutritional standards and the relative affordability of healthy food.
Response

Tobacco and Nicotine Products

Wales should strive to implement and support policies that remove tobacco products from the market and move the country closer to achieving an end game for tobacco. Marketing and promotion of tobacco products will have to meet updated health warning requirements and other measures coming into effect under the EU Tobacco Products Directive.³

Even before any proposed legislative changes, we encourage the Welsh Government to note the findings of the expert review of evidence on e-cigarettes recently published by Public Health England⁴ and to promote and support comprehensive monitoring of e-cigarette use (inclusive of all issues related to these products i.e. as a cessation tool; potential route into tobacco smoking; potential long-term health risks; etc.). If Wales goes forward with banning e-cigarette use in enclosed public places we strongly encourage Wales to ensure that the impact on smoking and vaping patterns is closely and comprehensively monitored and evaluated as it will serve as important evidence for this evolving topic.

We support the position that e-cigarettes should be regulated and made subject to robust and comprehensive marketing restrictions that provide the highest level of protection to children and young people, their presentation and marketing should avoid any confusion with smoked tobacco products or tobacco brands and they should always be presented clearly as an alternative to tobacco. Current self-regulatory rules governing the advertising of e-cigarettes introduced by the Advertising Standards Authorities in 2014 will be reviewed in October 2015 when the details of the EU Tobacco Products Directive are made known.

The current voluntary smoking bans for hospital grounds, school grounds and children's playgrounds are not sufficient. Legislation should mandate these bans.

Introducing a registration scheme will enable Trading Standards Officers to more easily identify tobacco retailers for test purchasing purposes and to check compliance with the point of sale display regulations. We believe that this is both a workable and proportionate measure and is an important means to help reduce the number of young people in Wales who become smokers.

According to Action on Smoking and Health (ASH), Trading Standards Officers have already advised that the existence of a register will make it easier for them to identify whether a retailer sells tobacco once the display ban on tobacco products comes into force for small shops in 2015. Data from England shows nearly half (44%) of young smokers reported they were able to acquire tobacco from retail premises despite the ban on the sale of tobacco products to under 18s.⁵ It is likely that

---

children in Wales are also getting tobacco from shops. We welcome and encourage any measure that helps to reduce the likelihood of underage tobacco sales.

We do not believe the fee will impose an excessive cost to small retailers. The requirement for annual registration will ensure that records are kept up-to-date for purposes of monitoring and enforcement.

We note that the detail of penalties associated with failure to register to sell tobacco will be subject to additional legislation. Any new penalties introduced should be: easy to enforce; provide clear guidance for enforcement officers and magistrates, and should be set at a level sufficient to deter breaches of the new requirements.

Executive summary

Non-communicable diseases (NCDs) are increasingly responsible for serious health and economic burdens to governments around the world. Most NCDs in all countries stem from risk factors including tobacco use, harmful use of alcohol, the over-consumption of saturated fat, sugar and salt, and lack of physical activity. Because treatment of these diseases is expensive, prevention is highly cost-effective. One way for governments to respond to the growing burden of NCDs is through the use of public health law in order to reduce exposure of their populations to these risk factors.

There are many effective ways in which public health law can be utilised to influence these risk factors. These may include litigation against industry, advertising or marketing restrictions, or taxation or pricing restrictions, all of which have proven remarkably effective in reducing risk factors. However, it may be politically difficult or unfeasible for individual local governments to pursue these types of legislation on their own, in the absence of more over-arching powers. This paper instead concentrates on four types of potential legislation highlighted in the recent Welsh consultation on public health law. These include: 1) extending the requirement to use Health Impact Assessments; 2) imposing a statutory duty on a range of bodies to reduce health inequalities; 3) legislation to bring about a renewed focus on prevention of ill health; and 4) legislation to strengthen community action around health protection and health improvement.

The paper examines a number of pieces of legislation in each of these four areas, from different jurisdictions in the UK and other countries in Europe, and in the United States, Canada, Australia and New Zealand, in order to provide precedents and, where available, feedback about success or challenges of each given approach. Throughout these approaches, the themes of multi-sectoral approaches and equity appear repeatedly. Faced with the growing burden of NCDs, governments have been finding effective and in some cases novel ways to use public health law to address relevant risk factors over the last decade. The four focuses of legislation listed above may be particularly appealing as ways of enabling local governments to effect changes in NCD rates, for three reasons: they are relatively less politically controversial than other possibilities; they are multi-sectoral approaches; and they focus on health inequalities.
1 Introduction

Non-communicable diseases (NCDs) create a serious health and financial burden for local and national governments. NCDs can be defined as diseases that are not infectious. These diseases may result from genetic or behavioural factors and include coronary heart disease, stroke, hypertension (high blood pressure), type 2 diabetes, kidney disease, certain forms of cancer, respiratory and liver diseases, and overweight and obesity, as well as certain mental health conditions. Most NCDs can be linked to the modifiable determinants of tobacco use, harmful use of alcohol, poor diet and lack of physical activity.

Legislation is one key tool to address these risk factors and determinants. While traditionally public health law has addressed issues of communicable diseases, the changing global burden of disease means that in recent decades it has also been used to address non-communicable disease.

There is a broad spectrum of ways in which public health law can address the determinants of non-communicable diseases. However, this paper will address four specific options in light of the over-arching themes of multi-sectoral engagement and the reduction of health inequalities. The first such option is legislation requiring Health Impact Assessments – tools that help decision-makers identify the public-health consequences of proposals that potentially affect health. The second involves imposing a statutory duty on a range of bodies to address and reduce health inequalities. The third is the use of legislation to bring about a renewed focus on prevention of ill health, both within and outside the health sectors. Fourthly, the use of the legislation to strengthen community action around health protection and health improvement will be reviewed.
2 Background to non-communicable diseases and public health law

2.1 The burden of disease

Non-communicable diseases (NCDs) include coronary heart disease, stroke, hypertension, type 2 diabetes, kidney disease, certain forms of cancer, respiratory and liver diseases, overweight and obesity, and mental health conditions such as vascular dementia. These diseases, which are often treatable but not always curable, are responsible for sizable economic burdens on governments. Most NCDs can be linked to the modifiable determinants of tobacco use, harmful use of alcohol, poor diet and lack of physical activity.

Over the past few decades, global health has witnessed a shift in the burden of disease from communicable to non-communicable diseases. Worldwide, the contribution of different risk factors to disease burden has changed substantially, with a shift away from risks for communicable diseases in children towards those for non-communicable diseases in adults.\(^i\) In 2008, nearly two-thirds of all deaths – 36 million – resulted from NCDs, comprising mainly cardiovascular diseases, cancers, diabetes and chronic lung diseases.\(^i\) NCDs disproportionately impact young and middle-aged adults, and on a global scale they are quickly becoming dominant causes of death and disability.\(^i\) Within the WHO European Region, NCDs account for 86% of deaths and 77% of the disease burden.\(^iv\) In the UK, NCDs are the leading cause of death, and in 2008 there were 518,400 deaths from NCDs, of which 23.75% were among the under-70s.\(^v\)

The economic burden of NCDs is sizable. A 2011 projection of costs carried out by the World Economic Forum and Harvard School of Public Health suggests that the cost of NCDs to the global economy will amount to $47 trillion over the next two decades, approximately 75% of the 2010 global GDP.\(^vi\) The cost of diabetes and related complications to the NHS in England and Wales amounts to an estimated £9 billion a year,\(^vii\) and over half of these cases could have been prevented. According to the World Health Organization, “Investing in prevention and better control of this broad group of disorders will reduce premature death and preventable morbidity and disability, improve the quality of life and well-being of people and societies, and help reduce the growing health inequalities they cause”.\(^viii\)

Though too rich and complex to explore comprehensively in this paper, there has been a sizable international response to the problem of NCDs. One of the most notable was the September 2011 UN High-level Meeting on Non-communicable Diseases which generated substantial global attention for the problem of NCDs. Similarly, in a World Health Assembly Resolution of May 2012, governments pledged to adopt a global target of a 25% reduction in premature mortality from NCDs by 2025.\(^ix\) NCDs are related to sustainable development issues including nutrition and energy, and there have also been calls to integrate NCDs carefully into the United Nations’ Sustainable Development Goals as well as the post-2015 Millennium Development Goals.\(^x\)

Clearly, governments have much to gain – and certain targets to meet – through the implementation of effective prevention techniques.
2.2 NCD risk factors and interventions

As stated above, the proximate causes of NCDs across all countries include tobacco use, harmful use of alcohol, the over-consumption of saturated fat, sugar and salt, and lack of physical activity. While many interventions may be cost-effective, WHO has classified some as ‘best buys’ – meaning “actions that should be undertaken immediately to produce accelerated results in terms of lives saved, diseases prevented and heavy costs avoided.” These are listed in Table 1.

Table 1: The World Health Organization’s ‘best buys’ for NCD interventions

<table>

</tr>
<tr>
<td>• Replacing trans fats in food with polyunsaturated fat</td>
</tr>
<tr>
<td>• Promoting public awareness about diet and physical activity, including through mass media.</td>
</tr>
</tbody>
</table>

There is substantial evidence of the success of preventive interventions. Frequently cited is the case of Finland’s North Karelia province, where a policy focused on healthy diet, exercise and reduction of smoking was implemented in the early 1970s. Between 1972 and 2006, North Karelia witnessed an 85% decrease in annual mortality rate from coronary heart disease. More recently, in New York City, a five-year-old Health Department regulation banning trans fats has reduced the consumption of trans fats among fast-food customers from about 3 grams to 0.5 grams per purchase – showing also that local health regulations can significantly influence public consumption.

It should be noted that corporate interests have markets to protect, and legislation restricting advertising, marketing or use of alcohol, tobacco and unhealthy foods may face numerous legal and political obstacles. Certain interventions require a cross-border approach. These may include advertising restrictions, labelling requirements, taxation and minimum unit pricing measures. A key example is the WHO’s Framework Convention on Tobacco Control – developed in response to the globalisation of the tobacco epidemic and the cross-border effects of many factors – which has made substantial progress in reducing tobacco consumption. One advantage of the four approaches outlined in this paper – and which will be appealing to national and local governments – is that the general and multi-
risk-factor NCD prevention strategies may be less likely to incur this kind of industry opposition.

2.3 The importance of public health law in improving population health

A central question in public health law and policy is what degree of intervention is appropriate to improve population health. In response to this, in 2007 the Nuffield Council on Bioethics presented a vision of the stewardship role of the state. Under this model, it is understood governments have a “duty to look after important needs of people individually and collectively”. Goals of public health programmes in this perspective should encompass reduction of risk, environmental protections, protections for vulnerable populations, health promotion, enabling the population to make healthy choices, access to medical services and a reduction of health inequalities.

Public health law can be defined as “the study of the legal powers and duties of the state to assure the conditions for people to be healthy (e.g. to identify, prevent and ameliorate risks to health in the population) and the limitations on the power of the state to constrain the autonomy, privacy, liberty or other legally protected interests of individuals for protection or promotion of community health”.

Law can be used to advance public health in a number of different ways. A 2011 report from the WHO Regional Office for Europe sets out four major roles: defining the objectives of public health and influencing its policy agenda; authorising and limiting public health action with respect to protection of individual rights, as appropriate; serving as a tool for prevention; and facilitating the planning and coordination of governmental and non-governmental health activities.

While in most European countries public health legislation is contained in separate acts and regulations because of the scope of the issues and stakeholders, another approach is to develop a law specifically addressing public health. In practice, most jurisdictions use a combination of the above approaches, with a specific public health law as well as provisions integrated into other legislation. Table 2 below, adapted from a WHO Regional Office for Europe document on public health law, reflects some of the benefits and disadvantages of each approach.

Source: Chichevalieva, 2011\textsuperscript{xix}

The legal system and public health situation will determine which of these options are most appropriate for a given government. Examples of each relevant to NCDs can be found within Europe:

- **In separate acts and regulations**: In 2009, a Portuguese law established standards to reduce the salt content in bread, set a maximum limit of salt content in bread and encouraged information on salt content on the labelling of pre-packaged foods.\textsuperscript{xx} Denmark has brought in a tax on trans-fatty acids, Hungary a ‘junk food tax’ and France a tax on all sweetened drinks.\textsuperscript{xxi}

- **Law specifically addressing public health**: The Netherlands Public Health Act (2008) created a single instrument bringing together the previously separate Public Health (Preventive Measures) Act, the Infectious Diseases Act and the Quarantine Act, as well as provisions for the obligatory storage of digital data in the context of health care for young people.\textsuperscript{xxii}

The purpose of public health law may vary considerably from country to country. Table 3 compares the stated purposes of a number of recent acts. These vary in specificity as well as in the extent to which they focus on communicable versus non-communicable diseases.

The number of public health law instruments within Europe is on the rise. A recent literature review found over 400 legally binding instruments in the area of public health at global and European levels, reflecting the expanding and complex nature of such a system in recent years. xxviii At the national level, there is increasing interest in legislation that can improve public health and avoid the fiscal and economic burdens associated with costly treatment of NCDs and loss of productivity.
2.4 How public health law is used to address NCDs and their risk factors

As explained in section 2.2, the risk factors for NCDs fall primarily into four categories: tobacco use, harmful use of alcohol, poor diet and lack of physical activity. Although public health law can be an effective mechanism for NCD prevention, two potential political obstacles include: firstly, strong public and political resistance to laws intended to influence choices and behaviours, with a perception of NCD risk factors being a matter of personal choice; and secondly, that effective interventions are difficult politically because it means challenging the rights of profitable businesses to manufacture and sell potentially harmful products. One Canadian article points out that – despite the public health crisis around NCDs – jurisdictional disputes, legal challenges, ideological opposition and doubts about effectiveness can all serve to forestall legislation in this area.

There are a number of ways in which law can influence behavioural risk factors for NCDs. These fall into the following categories: health infrastructure and governance; shaping the informational environment; creating economic incentives and subsidies; designing or altering the built environment; addressing health inequalities through economic policies; and command and control regulation, i.e. directly regulating persons, professionals, businesses and other organisations.

For example, improved infrastructure might be accomplished through the establishment of structures or institutions that support whole-of-government approaches to NCD risk factors. An improved informational environment could include restrictions on advertising of harmful products, inclusion of health warnings, or nutritional labelling. Fiscal strategies might include increasing excise taxes on tobacco and alcoholic beverages to reduce demand, and grants to encourage other levels of government to fund worthwhile interventions. An improved built environment could mean smoke-free places, zones with restrictions on sales of tobacco, alcohol or certain foods, improved school food, or environments facilitating physical activity.

In recent years in Europe, public health laws have often been introduced in response to specific disease threats, or to strengthen national public health institutes. However, as NCDs become an increasing burden on economies through treatment costs and loss of productivity, more and more governments are exploring how public health law can best manage NCD risk factors. Current laws relating to NCDs have proved to be an effective and central component of comprehensive prevention and control strategies.

“Although governments are increasingly using law in innovative ways to support chronic disease prevention, law’s role remains controversial. The food, tobacco and alcohol industries have lucrative markets to protect and there is a pervasive assumption that the solution to galloping rates of obesity, diabetes and other lifestyle diseases lies in individuals exercising greater self-control. But preaching self-control will not work if healthy choices are constantly undermined by other, more
powerful influences. While law is not a complete answer, it can help to create supportive environments for changing the average behaviour of populations.

The next four sections of this paper outline how the approaches identified in this discussion have been and can be used as tools in public health law. These four were selected as they are the focus of a current Welsh consultation on public health law. They are:

- extending the requirement to use Health Impact Assessments (section 3)
- imposing a statutory duty on a range of bodies to reduce health inequalities (section 4)
- legislation to bring about a renewed focus on prevention of ill health (section 5), and
- legislation to strengthen community action around health protection and health improvement (section 6).
3 Extending the requirement to use Health Impact Assessments

There has been increasing recognition that addressing public health issues effectively is a multi-sectoral undertaking – i.e. that public health agencies and the health care delivery system need support to adequately address the social, economic and cultural environments which impact health. This approach has been endorsed by many national governments, as well as by the WHO and the EU.

3.1 Background to Health Impact Assessments

In keeping with the emphasis on a multi-sectoral approach, Health Impact Assessments (HIAs) provide a means to assess all policy development in terms of its health impact. For example, transport, housing or education policy may all potentially protect or damage people’s health. WHO defines HIA as “a combination of procedures, methods and tools by which a policy, programme, or project may be judged as to its potential effects on the health of a population, and the distribution of those effects within the population.” xxxv The National Research Council (in the United States) defines HIA as “a systematic process that uses an array of data sources and analytic methods and considers input from stakeholders to determine the potential effects of a proposed policy, plan, program, or project on the health of a population and the distribution of those effects within the population.” xxxvi The Health in All Policies (HiAP) approach likewise recognises and addresses the fact that many of the determinants of health lie outside the health sector, and encourages governments to take a more inclusive approach through inter-sectoral and ‘whole-of-government’ policy and governance. xxxvii

HIAs are widely used internationally and nationally by public (and private) sectors. WHO notes that the benefits of HIAs include: the promotion of cross-sectoral cooperation; a participatory approach which values community views; provision of the best available evidence to decision-makers; improvement of health and reduction of inequalities; the possibility to strengthen the features of a proposal which will positively impact population health; flexibility; and links with sustainable development and resource management. xxxviii HIAs may also be effective in promoting accountability for decision-makers whose policies may have negative impacts on health. This aspect may explain why HIAs are also increasingly used by international organisations such as the World Bank and the International Monetary Fund as a condition for loans, and by international industry, for example mining.

In terms of NCDs, there are clear links between policy decisions in sectors such as agriculture, energy, housing and transportation and the risk factors for disease. These include, for example: agricultural policies which promote healthy food production; energy and housing policies which relieve fuel poverty and reduce the risk of respiratory and heart diseases; and transport policies which facilitate physical activity, helping to combat rates of obesity and diabetes. Some of these links are set out in Table 4.
<table>

3.2 The legal basis for a statutory duty to promote Health Impact Assessments

One means of ensuring that the public-health impacts of decisions taken in other sectors are considered is to impose a statutory duty on organisations and authorities to promote or to require HIAs.

At the European level, Article 152 of the Amsterdam Treaty states that: “A high level of health protection shall be ensured in connection with the formulation and implementation of all Community policies and all Community measures”; and Health 21 lists as one of its key strategies that “multisectoral strategies … tackle the determinants of health, taking into account physical, economic, social, cultural and gender perspectives, and ensuring the use of health impact assessment”\(^{\text{xl}}\). The adoption by the EU of a White Paper on HiAP (Health in All Policies) requires the European Commission and the Member States to ensure that health concerns are better integrated into all policies at Community, Member State and regional level, including in environment, research and regional policies, regulation of pharmaceuticals and foodstuffs, and governance of tobacco taxation and foreign policy.\(^{\text{xli}}\)

Another precedent can be found within UK legislation, where HIAs form part of the mandatory ‘Impact Assessment’ required by Government for all relevant policies, with the aim of developing better, evidenced-based policy by careful consideration of the impact on the health of the population.\(^{\text{xlii}}\) Impact Assessments are obligatory for all UK Government interventions of a regulatory nature that affect the private sector, civil society organisations and public services, and apply to primary and secondary legislation, as well as codes of practice or guidance.\(^{\text{xliii}}\)

Section 54 of Québec’s 2001 Public Health Act (implemented in 2002) requires government ministries and agencies proposing laws or regulations to first undertake an HIA. This obligation aims to ensure that legislation does not negatively impact population health and, concomitantly, to allow the Minister of Health and Social Services the capacity to share health-related concerns with other government ministries or agencies as necessary. A 2012 assessment found that, while initially there had been resistance to the measure from the affected ministries and agencies, there has been a consistent trend towards acceptance of the HIA process, with 519 requests for consultations between 2002 and 2012.\(^{\text{xliv}}\)

At the federal level in the United States, legislation proposed in January 2013 contains measures on Health in All Policies, which would require the Department of Health and Human Services to carry out HIAs of major non-health legislative proposals and to assign staff to other departments to help them consider the health impacts of their activities.\(^{\text{xlv}}\)

While HIAs are increasingly popular within the United States, they are rarely legislatively mandated at State or local level. A 2012 US study commissioned by the Health Impact Project looked at 36 selected jurisdictions where existing laws offered opportunities for health to be factored into a range of decision-making in which it would typically not otherwise be considered. Sectors included were environment and energy, transportation, agriculture, and waste disposal and recycling.\(^{\text{xlvi}}\) Only 22 of the 36 jurisdictions surveyed had laws requiring or facilitating HIAs. The authors highlighted that the laws that most clearly
facilitate HIAs feature two criteria: either “They refer to a broad range or description of health impacts, such as effects on public health, safety, general welfare, environmental health, health disparities, social or economic well-being, or effects that are borne disproportionately by vulnerable populations,” or “They call for studies or assessments that are used to inform public policy, programs, projects, regulations, or decision making”. Other, less ‘strong’ laws may simply allocate funding for or authorise evaluations of health impacts without making the link to policy decisions. One example cited was an Oregon statute authorising the state’s health authority to survey and investigate how the production, processing or distribution of agricultural products may affect the public’s health.

Summary
Health Impact Assessments are increasingly being required in a number of jurisdictions. In the case of Québec, an examination over ten years has shown that, while government departments were reluctant to work inter-sectorally at first, eventually the HIAs were accepted and collaboration from the health sector sought out. One issue for discussion is the extent to which HIAs are used: should they apply only to government undertakings (and to which ones?), or should they also apply more broadly to private-sector projects which also contribute to the NCD risk factors to which a given community is exposed?
4 Imposing a statutory duty on a range of bodies to reduce health inequalities

According to Marmot et al:

“The lower people are on the socioeconomic gradient, the more likely they are to live in areas where the built environment is of poorer quality, less conducive to positive health behaviours and outcomes, and where exposure to environmental factors that are detrimental to health is more likely to occur ... People who live in areas of high deprivation are more likely to be affected by tobacco smoke, biological and chemical contamination, hazardous waste sites, air pollution, flooding, sanitation and water scarcity, noise pollution, and road traffic. These people are less likely to live in decent housing and places that are sociable and congenial, of high social capital, that feel safe from crime and disorder, and have access to green spaces, adequate transport options, and opportunities for healthy living.”

There is a clear link between social inequalities and ill health, both because disadvantaged groups have poorer access to services, and also fewer resources in education, employment, housing, and transport, and reduced participation in civic society to make healthy choices. NCDs have a strong link to health inequalities, since opportunities to make healthy choices may be affected by social determinants including socioeconomic status, gender, ethnicity or education. Health inequalities are costly: UK estimates suggest that the consequences of inequalities in illness account for productivity losses of £31-£33 billion per year, and lost taxes and higher welfare payments in the range of £20-£32 billion per year.

Reducing health inequalities is not a straightforward undertaking, and policies should be clear about what is meant by promoting equity in health. One expert classifies policy responses into three groups: those aimed at improving the health of poor groups (e.g. by promoting smoking cessation or healthy eating among disadvantaged groups); those which work to narrow the gap between the health of disadvantaged groups and health in the population as a whole; and those which attempt to improve the health gradient with the greatest improvement for the poorest groups, and the rate of gain progressively decreasing for higher socioeconomic groups (e.g. a smoking cessation intervention which is available to the whole population but which is actively promoted via additional services for less advantaged groups, with the most intensive support for the most disadvantaged groups).

A focus on health inequalities may serve to better inform public health choices about the types of interventions used. For example, tobacco use and poor diet are major risk factors for cardiovascular disease, and a high-risk approach to cardiovascular disease prevention usually involves population screening, with those individuals above a particular risk threshold being given advice on behaviour change and/or medication to reduce blood cholesterol and blood pressure. However, it has been found that this approach exacerbates socioeconomic inequalities which have been reported in screening, healthy diet advice, smoking cessation, and statin and anti-hypertensive prescribing and adherence, and that a population-wide approach which legislates for smoke-free public spaces or for reducing salt intake could be more effective and reduce health inequalities. A 2012 American study suggested that – after adjustments for demographics, health care access, and physiological
distress – the level of education attained and financial wealth remain strong predictors of mortality risk among adults with diabetes.\textsuperscript{iii}

In Finland, the 2010 Health Care Act was designed in response to equity challenges in healthcare services, and contains provisions that give a number of new rights to patients. For example, patients can access health services outside their municipality, and each patient has the freedom to choose his or her own health setting and specialised healthcare unit (from 2014).\textsuperscript{lvii} Patients enjoy similar benefits under the Swedish 2011 Patient Care Act, which provides the right to choose care providers, the right to health care within a certain time, and a free choice of health centre.\textsuperscript{lviii}

Under the New Zealand Public Health and Disability Amendment Bill 2010 (which amends the New Zealand Public Health and Disability Act 2000), the objectives of the district health boards include: to reduce health disparities by improving health outcomes for Maori and other population groups; and to reduce, with a view to eliminating, health outcome disparities between various population groups within New Zealand by developing and
implementing, in consultation with the groups concerned, services and programmes designed to raise their health outcomes to those of other New Zealanders.

One approach suggested in the Welsh consultation on public health law is the imposition of a statutory duty on selected organisations to reduce health inequalities. For example, health boards could be required to address why take-up rates of health services may be lower in deprived groups. Section 1C of the UK Health and Social Care Act 2012 addresses the “Duty as to reducing inequalities” and provides that: “In exercising functions in relation to the health service, the Secretary of State must have regard to the need to reduce inequalities between the people of England with respect to the benefits that they can obtain from the health service”. The Act imposes explicit duties on the Secretary of State, the NHS Commissioning Board and clinical commissioning groups to have regard to the need to reduce inequalities in the benefits which can be obtained from health services. The duty applies to both NHS and public functions, and incorporates access to and benefits from health care services.

Summary
Many public health laws explicitly consider the issue of inequities. This could be either as a general principle to be applied in interpretation of the entire act, as well as specific duties such as in the Finnish act which gives new choices to patients, the New Zealand act which sets out responsibilities to district health boards, or the UK act which requires bodies to consider the reduction of inequalities when commissioning health services.
5 Legislation to bring about a renewed focus on prevention of ill health

Legislation may support prevention through reduction of risk factors, through the creation of bodies charged with disease prevention, or through specific activities relating to the financing of prevention.

5.1 Flexible legislation to reduce risk factors

While the category of ‘legislation to reduce risk factors’ could be construed quite broadly, this paper will focus specifically on public health laws which provide flexibility to address current and future NCD threats. This type of flexibility is another approach to dealing with particular threats as they arise – which we might see, for example, in Scotland’s 2008 Public Health Law which contains a provision prohibiting operators from allowing minors to use sunbeds.\textsuperscript{xii} Two relatively novel approaches can be found in the British Columbia Public Health Act and the South Australian Public Health Act.

The British Columbia Public Health Act (2008) not only allows the Minister of Health to require development of public health plans for health promotion and protection to address issues such as chronic disease prevention or inclusion of mental health and substance services in communities. It also enables the development of health impediment regulations, which address matters that adversely affect public health from long-term, cumulative exposures that cause significant chronic disease or disability, interfere with the goals of public health initiatives, or are associated with poor health in the population (e.g. foods high in trans fats).

In Part 8 of the South Australian Public Health Act 2011 (Prevention of non-communicable conditions), the Minister of Health is vested with the power to declare a particular non-communicable condition to be of significance to public health, which then allows the Minister to develop a code of practice in relation to preventing or reducing the incidence of the non-communicable condition. Such a code of practice can relate to: an industry or sector; a section or part of the community; or an activity, undertaking or circumstance. It may relate to: goods, substances and services; advertising and marketing; manufacturing, distribution, supply and sale; building and infrastructure design; or access to certain goods, substances or services. While not mandatory, performance reports can be published and breaches of a code of practice may result in enforceable compliance notices being issued. Additionally, there is a specific regulation-making power for taking measures to manage any non-communicable condition.\textsuperscript{xii}

These two laws grant Ministers of Health the powers to creatively and flexibly regulate those products and activities that impact the public health – a potentially valuable tool for reducing the risk factors for NCDs. This kind of flexibility can make it easier to respond to public health threats as they emerge and as evidence becomes available, without needing to resort to lengthy legislative processes.
5.2 Creating bodies and expanding mandates to tackle NCDs

Finland has merged the National Public Health Institute (KTL) and the National Research and Development Centre for Welfare and Health (STAKES) into one large and comprehensive entity, the National Institute for Health and Welfare (THL), which “provides the government with broad background research and expertise to serve public health and welfare and to support health and social services with expert advice, development, and monitoring and to help protect and promote the welfare of Finnish people by active communication and interaction in Finnish society.” This supports a multi-sectoral approach to health and has led to increases in alcohol and tobacco tax, a new soft drink and sweets tax, strengthening of tobacco control legislation and discussions with the Ministries of Agriculture, Education and Communications.\textsuperscript{lxiii}

In Article 6 of Greece’s Law on Public Health (2005), the Centre for the Control of Special Communicable Diseases was renamed the Hellenic Center for Disease Control and Prevention (KEELPNO) and its mission broadened to include NCDs, accidents, environmental health, a central public health laboratory, and the evaluation of health services.

In Iceland, amendments made in 2011 to the Medical Director of Health and Public Health Act incorporated the Public Health Institute of Iceland into the Directorate of Health, and expanded the mandate of the Directorate of Health to include public health measures and health promotion.\textsuperscript{lxiv} Functions include: advising the Minister of Welfare and other government bodies, health professionals and the public on matters concerning health, disease prevention and health promotion; and sponsoring and organising public health initiatives.\textsuperscript{lxv}

Similarly, the South Australian Public Health Act establishes a South Australian Public Health Council (SAPHC). This is the successor body to the Public and Environmental Health Council established under the previous Act. The principal difference between these two bodies is that the SAPHC has an expanded membership that reflects the broader scope of contemporary public health. The Act also provides terms of reference for the SAPHC that define a high-level strategic advisory role.\textsuperscript{lxvi}

5.3 Increasing budgets for prevention of ill health

Investments in prevention and in protecting and improving the population’s overall physical and mental health will have positive consequences in terms of healthcare spending and productivity. 2006 OECD data suggest that spending on prevention currently amounts to an average of 3% of OECD Member States’ total annual budgets for health, as opposed to 97% spent on healthcare and treatment.\textsuperscript{lxvii} Since prevention is a cost-effective measure, government intervention to shift resources towards prevention will result in long-term benefits.

The US Affordable Care Act establishes a Prevention and Public Health Fund (Section 4002). The Fund “aims to provide an expanded and sustained national investment in prevention and public health programs to improve health and help restrain the rate of growth in private
and public sector health care costs, with a dedicated fund for prevention and wellness”. The Secretary of Health and Human Services has the authority to transfer amounts from the Fund to increase funding for any programme authorised by the Public Health Service Act for “prevention, wellness, and public health activities including prevention research and health screenings, such as the Community Transformation grant program, the Education and Outreach Campaign for Preventive Benefits, and immunization programs.” The Fund will invest $12.5 billion in prevention activities over the decade 2013-2022. The Fund also supports the Community Transformation Grants that support local initiatives for chronic disease prevention.\textsuperscript{lviii}

This category may also include channelling specified funds into prevention. In Switzerland, the 2009 law on prevention and health promotion (\textit{La Loi Fédérale sur la Prévention et la Promotion de la Santé}) includes provisions requiring that certain proceeds from the LAMal (health insurance) are used for prevention, health promotion and early detection of diseases. Similarly, tax collected from tobacco producers and importers (destined under a 1969 law for health promotion measures) must be used specifically for tobacco control.\textsuperscript{lxix}

\textbf{Summary}

Use of legislation to bring about a renewed focus on prevention work can encompass a variety of measures. In looking at the flexible approaches to the reduction of risk factors, the creation of bodies charged with disease prevention, or specific activities relating to the financing of prevention, there are a number of recent developments that may be of interest to governments. These include: British Columbia’s and the South Australian Public Health Acts, which allow Ministries of Health to respond flexibly to NCD threats as they arise; the trend towards replacing or expanding the scope of communicable disease institutes to manage NCDs as well; and the recognition by the US Government of the importance of having funds earmarked for prevention through the Prevention and Public Health Fund under the 2010 Affordable Care Act.
6 Legislation to strengthen community action around health protection and health improvement

The fourth and final topic involves giving local communities an opportunity to be more involved in local decision-making on improving public health. Support for this approach can be found in documents such as the Action Plan for Implementation of the European Strategy for the Prevention and Control of Noncommunicable Diseases, which endorses empowerment and the ‘whole-of-society’ as key principles. ‘Empowerment’ means that all public health and healthcare activities should support community action, promote health literacy, and respect the patient, while the ‘whole-of-society’ approach is understood as encouraging cooperation and collaboration between public health and health care and between State and non-State actors, and engaging civil society, businesses and individuals in public health and healthcare decisions. Strategies like this are intended to facilitate patients to manage disease, adopt healthy behaviours and use health services effectively.

This section will focus on three interpretations of this type of legislative action: 1) using Health Impact Assessments as a support for community action; 2) mandates or programmes to share information about NCDs with communities; and 3) increasing the role of local government.

6.1 Using Health Impact Assessments as a support for community action

Clearly, this is closely linked to the discussion on HIAs in section 3, as throughout the HIA process communities will ideally play a critical role in identifying the health consequences of a given proposal. A participatory approach that values the views of the community, treating them as relevant stakeholders, will reinforce this perspective. Furthermore, the HIA process can demonstrate that organisers of a given project are eager to listen to, involve and respond to community members.

6.2 Sharing information about NCDs with communities

The concept of legislation to strengthen community action is also based upon the principle that communities have the right to receive appropriate information on reducing the risk of NCDs, empowering them to make appropriate healthy choices. Legislative precedents – and innovative policy and incentives – can be found in the United States, the UK, Finland and South Australia:

- United States – Title IV of the US Affordable Care Act (2010) addresses prevention of chronic disease. This contains a section addressing the creation of healthier communities through grants for community initiatives that will support more ‘walkable’ communities, healthier schools and increased access to nutritious foods in safe environments. One component of this strategy is the use of Community Transformation Grants, which may be used for programmes to promote individual and community health and prevent the incidence of chronic disease.
• **UK** – The UK Health and Social Care Act (2012) endorses the principle of “No decision about me, without me”. The phrase describes a vision of health care where the patient is an active participant in treatment decisions. To this end, legislative changes include: strengthening the voice of patients; imposing additional duties on Commissioning Groups, Monitor (the health care regulator) and Health and Wellbeing Boards to involve patients, carers and the public; and establishing Healthwatch England, a national body representing the views of service users, the public and local Healthwatch organisations.

• **Finland** – The Health Care Act (2010), section 11, states: “When planning and making decisions, local authorities and joint municipal authorities for hospital districts shall assess and take into consideration any effects that their decisions may have on the health and social welfare of residents.”

• **Australia** – Principle 11 of the South Australian Public Health Act (2012) states: “Individuals and communities should be encouraged to take responsibility for their own health and, to that end, to participate in decisions about how to protect and promote their own health and the health of their communities.”

6.3 **Increasing the role of local government**

A broader interpretation of the objective of strengthening community action would be to involve local government more in making public health decisions and policy. For example:

• **Finland** – The Health Care Act aims to give key responsibility for public health promotion to the municipalities in order to improve prevention and to reduce the demand for services which accompanies later stages of NCDs. The Act requires each municipality to monitor the health and welfare of its residents and to compile relevant statistics during terms of office.

• **Sweden** – Twenty county councils have the responsibility for the organisation of health care, and are also responsible for health and social care for the elderly. New changes under the 2011 Patient Care Act aim to better protect and involve patients in decisions.

• **UK** – Similarly, in the UK, the Health and Social Care Act (2012) grants new responsibilities to local authorities for improving the health of local populations. Components of the legislation require the engagement of a director of public health, a ring-fenced budget, and annual progress-charting reports. The rationale for this move is the notion that “wider determinants of health (for example, housing, economic development, transport) can be more easily impacted by local authorities, who have overall responsibility for improving the local area for their populations.”
Summary
Legislation is frequently used to strengthen community action promoting health protection and improvement. This can give local communities an opportunity to be more involved in local decision-making to improve public health. Some legislative examples come from programmes which endorse a multi-sectoral and community-oriented approach through inclusive processes, such as through the HIA process, or sharing information with communities (e.g. through the UK Healthwatch or the US Community Transformation Grants programmes); while others strengthen the role of local governments in health promotion and disease prevention (e.g. in Finland and the UK).
7 Conclusions

There are a number of tools available to national and local governments in order to address non-communicable diseases. Public health legislation, where appropriate, can be an extremely powerful mechanism in this regard. This paper has explored four legislative options: extending the requirement to use Health Impact Assessments; imposing a statutory duty on a range of bodies to reduce health inequalities; legislation to bring about a renewed focus on prevention of ill health; and legislation to strengthen community action around health protection and health improvement. Precedents in each of these areas, and particularly novel precedents in terms of granting flexibility to health authorities to address NCDs, will help governments to craft their own policy options.

The first discussion showed the increasing use of Health Impact Assessments, and cited a Québec study suggesting that mandatory HIAs will lead to better inter-sectoral collaboration.

The second considered the issue of inequities and a statutory duty on bodies to address and reduce health inequalities. Many public health laws list reducing inequities as a key principle (particularly in Scandinavian legislation). Furthermore, there are specific duties in, for example: the Finnish act which gives new choices to patients; the New Zealand act which sets out the responsibilities of district health boards; or the UK act which requires bodies to consider the reduction of inequalities when commissioning health services.

Legislation can bring about a renewed focus on prevention work through measures including flexible approaches to the reduction of risk factors, the creation of bodies charged with disease prevention, or through specific activities relating to the financing of prevention. Of particular interest are: British Columbia’s and the South Australian legislation granting health ministries the ability to respond flexibly to NCD concerns as they arise; and refocusing national health institutions to consider NCDs or earmarking funds for prevention, as in the US 2010 Affordable Care Act.

Fourthly, public health law can strengthen community action promoting health protection and improvement. This can be through programmes which endorse a multi-sectoral and community-oriented approach such as HIAs, community-based information-sharing programmes such as UK Healthwatch or the US Community Transformation Grants programmes, or increasing the role of local governments in health promotion and disease prevention as in Finland and the UK.

Throughout the discussion of the four highlighted legislative options we have repeatedly seen the key concepts of multi-sectoral approaches and of reducing inequalities. This paper has set out a few of the many precedents for ways in which public health law can be used to reduce risk factors for NCDs.

Appendix 2 – Event Report: Policy development roundtable

From the Public Health Perspective

Policy development roundtable event report on the Well-being of Future Generations (Wales) Bill

Background
In November 2014, the UK Health Forum, the Royal College of Physicians in Wales (RCP) and the Royal Society for Public Health (RSPH) partnered with University of Wales Trinity St David to host a policy development roundtable looking at the proposed aims, objectives and outcomes from the Well-being of Future Generations Bill and its potential impact on public health. This report highlights the key points from the day and the recommendations that arose from it.

Key points
- The Bill should provide an enabling framework which will galvanise and support the Welsh Government and other public bodies to proactively address emerging public health issues.

- The Bill must place a duty on Ministers to consider the health impact of all policies coming out of the Welsh Government.

- The title of the Bill should be changed to ‘Health and Well-being of Future Generations Bill’.

- The Welsh Government must take an integrated approach and consider the specific outcomes implied by this Bill in more detail. Ministers must provide detailed guidance and practical support to public bodies affected by this Bill.

About us
The UK Health Forum is a charitable alliance of professional and public interest organisations working to reduce the risk of avoidable non-communicable diseases (NCDs) by developing evidence-based public health policy and supporting its implementation through advocacy and information provision.

The Royal College of Physicians plays a leading role in the delivery of high quality patient care by setting standards of medical practice and promoting clinical excellence. We provide physicians in Wales and across the world with education, training and support throughout their careers. As an independent body representing more than 30,000 fellows and members worldwide, including 800 in Wales, we advise and work with government, the public, patients and other professions to improve health and healthcare.
The Royal Society for Public Health is an independent, multi-disciplinary charity dedicated to the improvement of the public’s health and wellbeing. Formed in October 2008 with the merger of the Royal Society of Health and the Royal Institute of Public Health, we help inform policy and practice, working to educate, empower and support communities and individuals to live healthily.

The case for change in Wales
The Welsh Government must take this opportunity to reduce health inequalities by addressing why so many people in Wales have poor health outcomes. We know that these outcomes can be linked to poverty, lifestyle, culture and deprivation. Many of these reasons are historical and deep-rooted in some communities in Wales, and will require a raft of measures.

Chronic disease (eg cardiovascular disease, diabetes, cancer, chronic respiratory disease) continues to place a heavy burden on the health service in Wales. Around a half of adults report being treated for an illness such as high blood pressure, respiratory illness, arthritis, mental illness, heart condition or diabetes and a third of adults report a limitation in their daily activities due to a health problem or disability (Welsh Government, 2014a). This high level of ill health also has a negative effect on economic growth due to the loss of income, productivity and capital formation. Indeed, levels of ill-health increase with levels of area deprivation. In general, those in the most deprived areas report the worst health (Welsh Government, 2014a).

Around 3 in 5 (58 per cent) adults are classified as overweight or obese, including just over 1 in 5 (22 per cent) adults classified as obese (Welsh Government, 2014a) and Wales has the second highest rates of adolescent obesity in Europe (WHO, 2012). Smoking continues to be the greatest single cause of avoidable mortality in Wales; around 21% of the population smoke (Welsh Government, 2014a), resulting in around 6000 smoking-related deaths every year (NHS Wales, 2007). Moreover, smoking is estimated to cause around 27,700 hospital admissions each year in Wales (Public Health Wales Observatory, 2012).

Around 2 in 5 (42 per cent) adults report drinking above the recommended guidelines on at least one day a week, including around a quarter (26 per cent) who report binge drinking (Welsh Government, 2014a). There are around 1000 alcohol-related deaths in Wales every year (Wales Centre for Health, 2009). Furthermore, this is already affecting future generations: in a survey of 40 countries, 13 year olds in Wales were the most likely to have been drunk twice (Wales Centre for Health, 2009). The scale of this public health challenge places a huge strain on the NHS in Wales.

The importance of public health law
A key part of the day’s discussions highlighted the general importance of public health law and its potential to contribute to improving and protecting the public’s health.

New legislation on public health would provide us with a collective response to preventing and reducing public health harms and would pave the way for future behaviour change. Legislation has a role in changing socio-cultural norms: by putting in place penalties for unacceptable behaviour, we make a statement about that behaviour. Two excellent examples of this approach are seat-belt legislation and smoke-free legislation, which are widely understood to be fundamentally-important catalysts in changing attitudes, expectations and behaviour in road safety and smoking respectively.

Law can be an essential tool for creating the conditions that enable people to live healthier lives. The World Health Organisation (WHO) ‘best buys’ for impacting on public health suggest that most of the really cost-effective interventions are regulatory (World Economic Forum, 2011) eg alcohol...
taxes, minimum unit pricing schemes, trans-fatty acid bans, tobacco advertising bans, plain cigarette packaging or a ban on smoking in public places. Many of the ‘best buys’ are linked to increases in tax and therefore create wealth for the economy. Furthermore, law is more effective and more cost-effective because it allows intervention on a much wider scale than can be directed at an individual. This gives legislation far more potential to alter the environment (Chokshi and Farley, 2012) and consequently, lead to wide scale behaviour change. Even if the effect of an altered environment on each person is small, the cumulative population effect can be large and the cost per capita is relatively small. Yet many public health laws that would produce a cost saving to society have not been put in place (Miller and Hendrie, 2012).

The prime objective of public health law is to pursue the highest possible level of physical and mental health in the population, consistent with the values of social justice. The state’s moral mandate is to protect its citizens from foreseeable threats of harm. This requires justifying where interference with individual rights to protect public health is a public good and where it is proportionate to the public health threat. Law also provides a public expression of cultural values and can change socio-cultural norms. This can create expectations on corporations, who may comply because they wish to be seen as good corporate citizens. Conversely, the absence of law also serves to send messages about acceptable behaviours and can send the message that the threat is minimal, imaginary or unimportant. This creates a legal environment which is harmful to public health through its failure to clarify unacceptable sources of health harms. Without a comprehensive and coherent legal framework, public health endeavours are weakened, hampering efforts to combat both communicable and non-communicable diseases and to protect public well-being.

The focus of public health should therefore lie on preventing, not just managing poor health. Many of the underlying reasons for health inequality in Wales cannot be solved by solely local initiatives and local authorities but will need a more strategic national approach by the Welsh Government.

**Key recommendation:** The Well-being of Future Generations Bill should provide an enabling framework which will galvanise and support the Welsh Government and other bodies to address emerging public health issues proactively as they arise.

The Welsh Government should be prepared to use a number of public health interventions available (including regulation) and must coordinate action across different government departments and partners. We are supportive of legislation that takes an ‘all society’ approach to a broader conception of health problems and we would support a requirement on appropriate bodies to consider how to reduce and prevent health inequalities and involve communities in their decision making. However, we urge Welsh Government to consider the specific outcomes implied by this Bill in more detail as soon as possible.

**Public health legislation in Wales**

The Welsh Government has announced two distinct pieces of public health legislation for the fourth Assembly: the Well-being of Future Generations Bill and the Public Health Bill.

The Well-being of Future Generations Bill seeks to ensure that sustainable development is the central organising principle of the Welsh Government and public bodies in Wales, in line with the 2009 Sustainable Development Scheme ‘One Wales, One Planet’ (Welsh Assembly Government, 2009). The Welsh Government has an almost unique duty to ensure that sustainable development is included as a priority at all levels of government.
The definition of sustainable development used in the 2012 white paper is ‘enhancing the economic, social and environmental wellbeing of people and communities, achieving a better quality of life for our own and future generations in ways which: promote social justice and equality of opportunity; and enhance the natural and cultural environment and respect its limits – using only our fair share of the earth’s resources and sustaining our cultural legacy’ (Welsh Government, 2012). However, despite the Welsh Government’s statutory duty to promote sustainable development, a 2011 WWF report suggested that sustainable development is far from embedded (WWF, 2011) because the legal duty is to ‘promote’ rather than to ‘achieve’ sustainable development.

The two key aims of the Well-being of Future Generations Bill are to legislate to make sustainable development the central organising principle of the Welsh Government and public bodies in Wales, and to create an independent sustainable development body for Wales. The Bill seeks to address issues including climate change, skills, employment, poverty, health inequalities, biodiversity decline and environmental limits.

While sustainable development is often understood to be an environmental issue, this overlooks many of its other important aspects. This Bill aims to encourage wider thinking about the concept and contains six well-being goals: a prosperous Wales; a resilient Wales; a healthier Wales; a more equal Wales; a Wales of cohesive communities; and a Wales of vibrant culture and thriving Welsh language. These goals are linked to the social, economic and environment well-being for the people of Wales. ‘A healthier Wales’ is defined as ‘a society in which people’s physical and mental well-being is maximised and in which choices and behaviours that benefit future health are understood’ (Welsh Government, 2014b).

The Bill relates only to forty-four public sector organisations, including the Welsh Government, local authorities, and NHS local health boards and trusts. It will not apply to private or third sector organisations. The Bill will create an independent Future Generations Commissioner who will monitor outcomes and ensure support for public bodies.

The second major piece of public health legislation will be the Public Health Bill. The recent White Paper proposed the introduction of minimum alcohol unit pricing; a tobacco retailers’ register; and a ban on the use of e-cigarettes in public places. A Bill is expected in 2015.

**A ‘health in all policies’ approach**
Integration and collaboration on public health must be embedded across the NHS, local authorities and the Welsh Government.

**Key recommendation:** The Well-being of Future Generations Bill must place a duty on Ministers to consider the health impact of all policies coming out of the Welsh Government and other public bodies.

We strongly urge the Welsh Government to consider how best to ensure that reducing inequality and improving health outcomes underpins everything they do by implementing a ‘health in all policies’ approach.

**Other recommendations**
- **The title of the Bill should be the ‘Health and Well-being of Future Generations Bill’**
  The Bill must send a clear message that health outcomes underpin the success of this legislation. The title of the Bill should include the word ‘health’. In addition, the definition of
‘a healthier Wales’ should include the word ‘health’, that is ‘a society in which people’s physical and mental health and well-being is maximised and in which choices and behaviours that benefit future health are understood’ (Part 2, Section 6(1) Wellbeing goals).

Assessments of local well-being should be ‘a public services board must prepare and publish an assessment of the state of economic, social and environmental health and well-being in its area’ (Chapter 2, Section 35(1) Assessments of local well-being).

- **The Welsh Government must take an integrated approach and consider the specific outcomes implied by this Bill in more detail. Ministers must provide detailed guidance and practical support to public bodies affected by this Bill**

  We are not convinced that the current Bill will be a truly effective piece of legislation. A great deal of work still needs to be done to ensure that the Bill makes a tangible difference to the lives of future generations in Wales. Ministers should take an integrated approach to implementing this legislation, and provide detailed guidance and practical support to public bodies when the Bill is enacted, especially around the sharing, if appropriate, of budgets.

  The Bill should make provision about the contents of accompanying guidance. In the short term, the Welsh Government should work with public bodies to review existing activity to understand what local service boards are already doing. National and local indicators will need to fit together effectively and should be chosen to measure progress in the best way, not just the easiest way. Furthermore, Ministers should consider the impact on private and voluntary sector organisations and how these bodies can be encouraged to work within the framework of the Bill.

- **The Bill must ensure that accurate, relevant data is collected, reported and monitored**

  We note chronic, longstanding problems of gaining access to data which is already being collected. This is vital to ensure independent and authoritative data. The Bill should place a duty on public bodies to collect and store appropriate data so that it can be independently used to demonstrate that the Bill can make a difference. The 2008 Public Health Act in Netherland included ‘provisions for the obligatory storage of digital data in the context of healthcare for young people’ and there is no reason why there could not be specific provision for data storage and collection in Wales. The types of data referred to in the Bill should be defined more clearly, and the Welsh Government should explore whether there is a role for the Commissioner in data collection and sharing. This could improve accountability and give the Commissioner the responsibility for monitoring the health and well-being of the most vulnerable people in Wales.

- **The Bill should place a duty on Ministers to improve health outcomes for children and pregnant women**

  There is no mention of women or children in the Bill. Yet we know that health inequalities begin from early life experiences and cast a long shadow: a healthy pregnancy and healthy early years are vital. To protect the health and well-being of future generations, the Bill should recognise that epigenetic effects in the womb and modifiable risk factors (eg stress, smoking, alcohol) have an impact not just on the individual, but on the next generation. The Bill should acknowledge this through Goal 4: A more equal Wales. Please see further discussion of this point at annex 1 of this paper.

- **The Bill must ensure that public bodies listen to and work with communities**

  Ensuring that this Bill is effective will rely on building communities where green space, physical activity, access to food and a healthy environment are all integrated. While laudable, this will be very difficult to achieve and to monitor. Public bodies, including the
Welsh Government should work closely with communities to ensure that the potential for social change is not wasted.

- **The Bill should be designed along Cynefin principles**
  The Cynefin framework is a decision making tool that deals with the complexity and unpredictability of the world. It ‘signifies the multiple factors in our environment and our experience that influence us in ways we can never understand’ (Snowden and Boone, 2007). Cynefin principles should be used to understand and respond to the complexity associated with creating a Wales that lives up to the six goals in the Bill. Research suggests that the appearance of a neighbourhood is positively correlated with the self-reported health and well-being of community members. There is also a positive correlation between social cohesion and mental health in close-knit communities: ‘trust in others has been repeatedly found to be a vital support for happier lives’ (OECD, 2014).

Annex 1 – Improving health outcomes for children and pregnant women

Based on the fact that the NHS is the only statutory body in contact with all mothers and children in their early years, and the leading role that local government plays in education and other services, this Bill should:

- Place a duty on the Welsh Government to prepare an Early Start Plan every four years, setting out how it will aim to ensure every child has the chance to grow up fit and healthy and achieve school ready status, which would:
  - Identify and report by local area on aspects of poor health
  - Identify the responsibilities of different agencies to tackle them
  - Propose actions to target the most deprived communities and reduce the gap in outcomes.

- Place a joint duty on local health boards and local authorities to prepare child health improvement and health equality plans every four years, setting out how with others they will act. This should require them to set out how they would:
  - Identify differences in health status in different communities
  - Design and implement a programme to improve outcomes
  - Target the most deprived communities and reduce the gap in outcomes
  - Report annually on progress.

- Place a duty on Public Health Wales to advise the responsible bodies on effective interventions to discharge their duty

- Place a duty on the Wales Audit Office to monitor progress, especially through reviewing the plans.
